

POTENTIAL IRRITANCY OF A COSMETIC PRODUCT ON SENSITIVE SKIN

The test was carried out on 20 male and/or female volunteers, aged between 23 and 59 years with sensitive skin. The skin area intended for the test was cleansed with a 70% alcohol solution followed by the application of the product to be tested. This product was kept in contact with the skin for 48 h with an occlusive patch. Subsequent skin reactions were observed 15 minutes, 1 and 24 h after removal of the product and evaluated by describing the severity of any erythema or edema present by scoring.

Based on the data collected, the average skin irritation index (IIM) was calculated, which allows the classification of the product under study according to the criteria shown in the table:

INDEX	CLASSIFICATION
from 0,0 to 0,5	non irritating
from 0,5 to 2,0	slightly irritating
from 2,0 to 5,0	moderately irritating
from 5,0 to 8,0	highly irritating

None of the 20 test subjects showed any skin reactions following the application of the following products:

- EN05 Cannabidiol moisturizing cream
- EN06 Cannabidiol anti-ageing cream
- EN07 Cannabidiol body lotion
- EN08 Cannabidiol face and neck cleanser

RESULT

Being 0,50 the IIM limit above which the product is classified as irritant, the tested product is classified as non-irritant as it was found to have a value of IIM = 0,00.
